

F What a short run cannot show. Each trajectory is referenced to its OWN first analysed frame; the two must not be subtracted. F1 blocks are descriptive; no error bar is a confidence interval here.

F1 Block means — DESCRIPTIVE only
no error bars: blocked frames are correlated, so an SEM here is not a CI

F2 Coverage: NEW = 1.8% of the upstream run
same frame count is not the same information

F3 Distributions overlap only partly
small n; no significance test is implied
